                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -:- TISSUE SPECIFICITY: Widely expressed.
-:- PTM: The soluble form is produced from the membrane form by proteolytic processing (By similarity).
-:- SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               weakly induces apoptosis.";

                                                                                                                                                                                                                                                                              AR LOCATION: Type II membrane protein and secreted. ECIFICITY: Highly expressed in adult heart, pancreas, muscle, brain, colon, small intestine, lung, ovary, spleen, lymph node, appendix and peripheral blood es. Low expression in kidney, testis, liver, placenta, d bone marrow. Also detected in fetal kidney, liver,
                                                                                                                                                Binds to FN14 and possibly also to TNRFSF12/APO3. We apoptosis in some cell types. Mediates NF-KappaB n. May promote angiogenesis and the proliferation of all cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     iogenesis; Apoptosis; Transmembrane; Glycoprotein;

(G-198) to the BMEL/GenBank/DDBJ databases.
Cytokine that binds to TMPRSF5. Mediates B-cell
tion in the absence of co-stimulus as well as IgE
in in the presence of IL-4. Involved in immunoglobulin
Homotrimer (By similarity).
Homotrimer (By similarity).
AR LOCATION: Type II membrane protein. Also exists as
ular soluble form (By similarity).

Induces the proliferation of activated peripheral blood T cells. May have role in activation-induced cell death (AICD). May play a role cognate interactions between T cells and B cells/macrophages. -!- SUBGNIT: Homotrimer (Potential).
-!- SUBGRILULAR LOCATION: Type II membrane protein.
-!- IISSUE SPECTICITY: EXPRESSED IN BRAIN, PLACENTA, LUNG, SKEL! MUSCLE AND KIDNEY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDINE=94374434; PubMed=8088337; Adderson M.R., Smith C.A., Tough T.W., Davis-Smith T., Armitage F Falk B., Rows E., Baker E., Sutherland G.R., Din W.S., Goodwin R. with the 14-3-3 protein YWHAE, MEF2A, MEF2B and MEF2C arity). Interacts with HTATIP and EDNRA.

*** LOCATION: Nuclear and cytoplasmic. In the nucleus, it is with distinct submuclear dot-like structures. Shuttles ne nucleus and the cytoplasm. Treatment with EDNI results ing from the nucleus to the perinoclear region. The cytoplasm depends on the interaction with the 14-3-3 WHAE and may be due to its phosphorylation.
                                                                                                                                                                                                                                                                                                                              experimental confirmation available; he shuttling between the nuclear export sequence mediates the shuttling between us and the cytoplasm [By similarity]. be phosphorylated by CaMKI (By similarity). Be phosphorylated by CaMKI (By similarity). Seconds: a cativity is inhibited by Trichostatin A (TSA), istone deacetylase inhibitor (By similarity). Y: Belongs to the histone deacetylase family. Subfamily

L EMBO J. 13:616-624(1994).

-!- PUNCTION: Essential for the control of the cell cycle at the (mitosis) transition. G2/M cycline accumulate steadily during and are abruptly destroyed at mitosis.

-!- SUBUNIT: Interacts with the CDC2 and CDK2 protein kinases to a serine/threonine kinase holoenzyme complex. The cyclin submimparts substrate specificity to the complex.

-!- DEVELOPMENTAL STAGE: Accumulates steadily during G2 and is abruptly destroyed at mitosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-FEB-1994 (Rel. 28, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytokine that binds to TNFRSF3/LTBR. Binding to the sptor TNFRSFB modulates its effects. Activates NFRB, is the proliferation of T cells, and inhibits growth of actionem HT-29. Acts as a receptor for Herpes simples.
                                                                                                                                                                                                                                                                                                          McDonnell P.C., Brigham-Burke M., Lyn S.D., Minton J., le K., Spampanato J., Silverman C., Hensley P., Emery J.G., Deen K., Eichman C., Chabot-Fletcher M.,

calcineurin, and NP-AT.";

Cell 96:611-614(1999).

-!- FUNCTION: Plays a role in the inducible expression of cytokine genes in T cells, especially in the induction of the IL-2 and 4 (By similarity).

-!- SUBUNIT: Member of the multicomponent NFATC transcription computate consists of at least two components, a pre-existing cytoplasmic component NFATC2 and an inducible nuclear component NFATC1. Other members such as NFATC4, NFATC3 or members of the activating protein-1 family, MAP, GATA4 and Cbp/p300 can also the complex. NFATC proteins bind to DNA as monomers.

-!- SUBCELLULAR LOCATION: Cytoplasmic for the phosphorylated form

fter activation that is controlled by calcineurin-
lephosphorylation. Rapid nuclear exit of NFATC is thought
mechanism by which cells distinguish between sustained
ient calcium signals. The subcellular localization of
y a key role in the gene transcription.
SCIFICITY: Highly expressed in placenta, lung, kidney,
a ovary. Weakly expressed in spleen and thymus. Not
in peripheral blood lymphocytes.
Is Similarity Domain (RSD) allows DNA-binding and
we interactions with API factors (By similarity).
phorylated by NFATC-kinase; dephosphorylated by
in (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GRGPEDSWILLISAPGPTPASPRGRKRYSSSGTPSSA-----SPALSR 286

The sequence is that of human tumour necrosis factor related ligar (TRELL). TRELL or active fragments can be included with a carrier pharmaceutical compositions to treat cancer, autoimmune diseases cimmune responses to tissue grafts, or to stimulate or suppress the system. It is useful to screen for TRELL receptors, by labelling we detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for then be administered, optionally with interferon-gamma, to induce death or treat, suppress or alter immune responses (especially inv

33- ligand (a tumor necrosis factor) homologue

1; 74pp; English

sequence represents a human tumour necrosis factor (TNF) and

```
lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosis mammalian cancer cells, to induce NF-kappaB-dependent transcripti to induce JNK/SAPK-dependent responses in mammalian cells
                                                                                                                  Ü

The present sequence represents a TWEAK protein. The specification describes a method for preventing or treating an immune response in an animal. The method compadministering a TWEAK blocking agent. The method may be used for preventing and TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inapproprexpression and/or activity of TWEAK. These disorders include autoidiseases, acute and chronic inflammation, organ transplant rejectifactive compact transplant rejectifactive of shock, loss of immune responsiveness (as seen in himmunedeficiency virus (HIV) infections) and failure of the immune
                                                                                                                                                                                                                                                                                                                                                                                                    Preventing and treating immune responses using modulators, especia antibodies, of TWEAK, TWEAK receptors and TWEAK ligands, useful fc treating e.g. inflammation and graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        36 MAARRSQRRRGRRGEPGTALLVPLALGLGLALACLGLLLAVVSLGSRASLSAQEPAC

ucleic acids encoding PRO polypeptides, useful for treating ignant tumors, leukemias and lymphoid malignancies, angiogenic and immunologic disorders.

nvention relates to the isolation of novel human PRO and the polynuclectide sequences encoding them. The PRO agonists, antagonists or anti-PRO antibodies are useful for on or malignant tunnours (e.g. renal, kidney, bladder, leukaemias and lymphoid malignancies, other disorders such glial, astrocytal, hypothalamic, glandular, macrophagal, lastocoelic disorders, inflammatory, immune and angiogenic e polymucleotide sequences are also useful in gene therapy.

New heteromultimeric complex having a first polypeptide member of tumor necrosis factor (TNF) ligand family, and a second different of TNF ligand family, useful for treating cancer, osteoporosis or autoimmune disease.

WPI; 2003-430659/40.

N-PSDB; ACC57901.

Disclosure; Page 368-369; 388pp; English.

The present sequence is the protein sequence for human TWEAK prot invention relates to compositions comprising heterotrimeric complication, necrosis factor (TNF) ligand family members, and their use detection, prevention and treatment of disease. In one embodiment heterotrimeric complex comprises full-length or extracellular por TWEAK and full-length or extracellular portions of other TNF ligationly members, preferably VGGI or VGGI-SV. The heterotrimeric coff the invention are useful for treating an autoimmune disease, osteoporosis, and particularly for inhibiting cancer cell prolife increasing B cell proliferation, or inducing apoptosis of T cells

individual having a disorder associated with excessive bone resorp e.g. osteoporosis, Paget's disease or arterial calcification. Trea individual having a disorder associated with insufficient bone res comprises administering an endokine alpha antagonist, which is the antibody that binds specifically to endokine alpha polypeptide. The present sequence represents the amino acid sequence of a tumour ne factor family ligand.

The present invention relates to extracellular signal molecules, particularly members of tumour necrosis factor (TNF) family molec designated as TREPA (TNF related endothelium proliferative agent) Soluble biologically active TREPA are used to treat TREPA-associa diseases, tumours or metastases. TREPA is used for inducing angio in human for promoting wound healing and for vascularising grafte for successful grafting and to promote tissue grafts. The present acid sequence is clone ID #690050 human TREPA
                                                                  Inducing angiogenesis in mammal at desired sites for promoting wo healing, by administering soluble fragment of extracellular domaitumor necrosis factor related endothelium proliferative agent pro

The sequence represents a a fusion protein encoded by the express vector pDC409-LZ-TWEAK. The fusion protein comprises a growth hor leader, a leucine zipper multimerisation domain, and the extracel domain of human TWEAK. The fusion protein was used in the isolatic human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human TWEAK receptor (TWEAKR)-expressing clones from a COS cell human fusion family and induces angiogenesis: TWEAKR may therefore be us creen for and develop TWEAKR agonists and antagonists for the most close of angiogenesis, to be used in the treatment and diagnosis of hum classe: The disorders mediated by angiogenesis include coular dicharacterised by ocular neovascularisation such as diabetic retin neovascular glaucoma, retinoblastoma, retinopathy of prematurity, retroental fibroplasia, rubeosis, uveitis, macular degeneration corneal graft neovascularisation, and inflammatory diseases such arthritis, rheumatism and psoriasis. Other treatable diseases inc malignant and metastatic conditions such as sarcomas and carcinom benight tumours and preneoplastic conditions, myocardial angiogene hemophilic joints, scleroderma, vascular adhesions, atherosclero plaque neovascularisation, telangiectasia, wound granulation, corestered and ischaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating anglogenesis in a mammal for treating diseases mediate anglogenesis, e.g. solid tumors and vascular deficiencies of card peripheral tissue, by administering antagonist or agonist of TWEA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                78 SLGSRASLSAQEPAQEELVAEEDQDPSELNPQTEESQDPAPFLNRLVRPRRSAPKG

mosis Factor family receptor polypeptides and ligands - agnosis and treatment of prostate cancer and developmental abnormalities.

y 13A; 156pp; English.

on describes isolated Tumor Necrosis Factor (TNF) family peptides: APO4, APO6, APO8 and APO9 or their active of isolated TNF related ligands I and 3 (TNRL1 and TNRL3) or fragments. APO4 is useful for diagnosing prostate cancer by levels of APO4 in an individual. Prostate cancer can also be polypeptides are also useful for identifying selective by the calls useful in diagnosis/treatment of disease by binding of a polypeptides are also useful for identifying selective the call surface. The binding is preferably performed in alypeptides/active fragment which is extracellular, or the call surface. The binding and observing the changer in APO4 disease are also identified using APO4 polypeptides/active fragment useful in diagnosis or disease are also identified using APO4 polypeptides/active 1 APO4 signal transducer molecules that specifically interact lasmic domain of APO4 and detecting a change in level of APO4 e method is performed in vivo or in vitro. APO polypeptides ul as immunogens for preparing antibodies, APO4 is also iagnosis/treatment of developmental or gestational nduced apoptosis

Tumour necrosis factor related ligand - useful for, e.g. treatin auto-immune disease and immune responses to tissue grafts.

The sequence is that of mouse tunnour necrosis factor related lig (TRELL). TRELL or active fragments can be included with a carrie pharmaceutical compositions to treat cancer, autoimmune diseases immune responses to tissue grafts, or to stimulate or suppress to immune responses to tissue grafts, or to stimulate or suppress to system. It is useful to screen for TRELL receptors, by labelling detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for then be administered, optionally with interferon- gamma, to induce death or treat, suppress or alter immune responses (especially intument adenocarcinoma cells) involving a signal pathway between Tries receptor. It's coding sequence can be used in gene therapy for related disorders in mammals (especially humans), e.g. tunnours, autoimmune and inflammatory diseases or inherited genetic disord introcells, and expressing, therapeutically effective of a vector, e.g. a virus comprising a gene encoding TRELL. It is natural/synthetic DNAs for TRELL-encoding sequences and for anticipal variations. Claim 12; Page 48-50; 69pp; English.

. treating immune responses using modulators, especially TWEAK, TWEAK receptors and TWEAK ligands, useful for inflammation and graft versus host disease. ਰ ਘੁ

ig 1; 45pp; English.

equence represents a TWEAK protein. The specification ethod for preventing or treating an immunological disorder ting an immune response in an animal. The method comprises a TWEAK blocking agent. The method may be used for distrain immune disorders associated with inappropriate d/or activity of TWEAK. These disorders include autoimmune the and chronic inflammation, organ transplant rejection, Host disease (GVHD), lymphoid cell malignancies, septic and stock, loss of immune responsiveness (as seen in human incy virus (HIV) infections) and failure of the immune umour growth

Chaudhary PM;

WPI; 1999-205191/17. N-PSDB; AAX23425 New Tumor Necrosis Factor family receptor polypeptides and ligand useful for diagnosis and treatment of prostate cancer and develog or gestational abnormalities.

Claim 40; Fig 13B; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) fan receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 (TNRL1 and The their active fragments. APO4 is useful for diagnosing prostate of certaining levels of APO4 in an individual. Prostate cancer can created using APO4 aclective binding agents linked to a therapeut moiety. APO4 polypeptides are also useful for identifying selective binding agents, useful in diagnosis/treatment of disease by binding agents to the polypeptide/active fragment which is extracellular, expressed on the cell surface. The binding is preferably performed vivo. APO4 polypeptides/ active fragments are also useful for science for signification of the changes activity. Effective pharmacological agents useful in diagnosis of treatment of disease are also identified using APO4 polypeptides.

APO4 signal transducer molecules that specifically interact asmic domain of APO4 and detecting a change in level of APO4 method is performed in vivo or in vitro. APO polypeptides a simumnosgens for preparing antibodies. APO4 is also agnosis/treatment of developmental or gestational . APO8 was transfected to human breast carcinoma cell line duced apoptosis
